Google Cloud H2S

Gen AI Academy

APAC Edition

Build in APAC. Build for the world.

Participant Details

a. Participant name: Saiteja Reddy Kasireddy
b. Problem Statement: Build and deploy a single AI agent using ADK and Gemini hosted on Cloud Run.

Brief about the idea

A lightweight agent that accepts text input via HTTP endpoint.
Uses ADK to wrap Gemini model.
Returns concise summaries.
Deployed on Cloud Run for scalability and easy access.

Meeting the Build Criteria

- How did you navigate the requirements of your chosen track to build a custom solution - using ADK, MCP, or AlloyDB AI that effectively addresses the 'What You Must Build' criteria?

Implemented using ADK.
Uses Gemini model for inference.
Hosted on Cloud Run with an HTTP endpoint.
Performs one clearly defined task: summarization.
Meets all requirements of the challenge track.

Opportunities

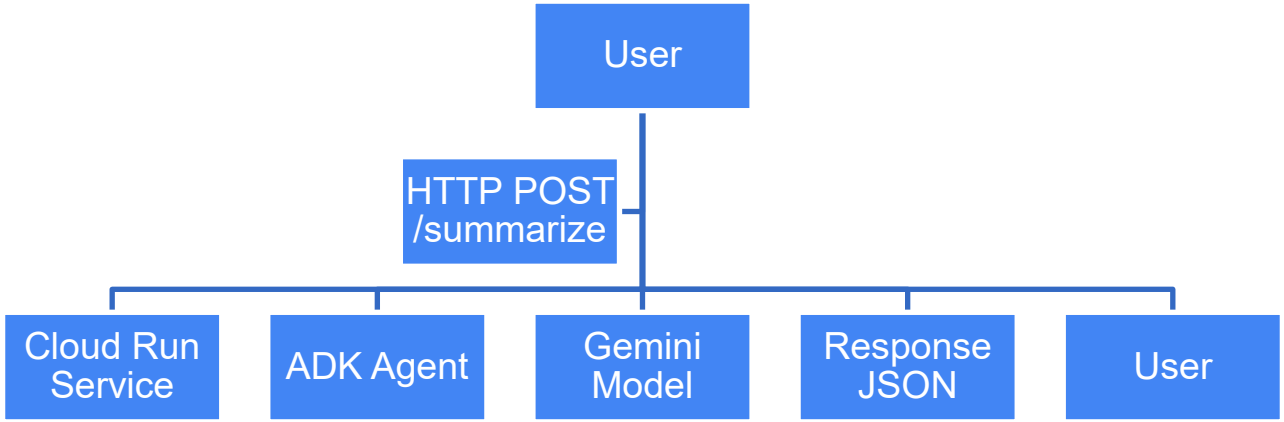
- How different is it from any of the other existing ideas?
- How will it be able to solve the problem?
- USP of the proposed solution

Differentiates from generic summarizers by being cloud-native and agent-structured.
Solves the problem of quick, scalable summarization for any text input.
USP: Minimal, single-purpose agent that is easy to extend and deploy.

List of features offered by the solution

HTTP endpoint /summarize
JSON input/output
Environment-configurable model and instructions
Secure deployment with IAM roles
Scalable on Cloud Run

Process flow diagram or Use-case diagram



Technologies to be used in the solution

ADK (Agent Development Kit)
Gemini model (Vertex AI)
Flask for HTTP server
Docker for containerization
Cloud Run for hosting
gcloud CLI for deployment

Snapshots of the prototype
